

Kits

09/04/2026 10:11 am EDT

This feature allows the grouping of individual parts into a single, cohesive product assembly. Whether you are creating a "cat-back" exhaust or bundling multiple components into a convenient package, Kits streamline the process of selling assembled products.

The Purpose of Kits

A kit acts as a single end component made up of multiple subcomponents. Instead of selling individual parts separately, Kits allow you to bundle these components together, providing value to customers through convenience and simplicity.

Key benefits include:

- **Flexible Assemblies:** You can build kits from diverse parts, even across different brands, as long as you have access to those products in your system.
- **Customization:** You can define a custom price for the kit that differs from the sum of its individual parts, allowing you to charge a premium for the convenience of the bundled package.
- **Simplified Fulfillment:** By packaging multiple items into one, you offer a more streamlined shopping experience.

How to Use Kits

To set up a kit in Mecka, follow these general steps:

1. **Access Part Search:** Use the part number search function to identify and select the specific parts you wish to include in your kit.
2. **Assign Components:** Add the selected parts to your kit. You can define the quantity for each component to ensure the kit reflects the correct assembly requirements.
3. **Manage Sold Separately:** Decide whether the components within the kit should be sold separately or exclusively as part of the kit.
4. **Define Pricing:** Set a manual price for the entire kit. This does not need to be the sum of the individual parts; you can adjust this to account for the assembly and packaging value.
5. **Finalize the Kit:** Once saved, the system treats the kit as a new product. The kit will be assigned its own part number, with the individual sub-part numbers listed in brackets for reference.
6. **Visual Representation:** Just like any other product, ensure you have proper images of the assembled kit to represent it accurately to your customers.

Important Note on Inventory:

To effectively sell kits, it is recommended that you have the stock for the components in-house. While you can create kits from various parts, the fulfillment process is most efficient when you have the

inventory on hand to package, label, and photograph the assembled product yourself.
